

Q to InFusion

upgrade imperative

Today, users of automation systems expect a level of control that simply wasn't available before the technology boom. With the developments surrounding the Internet of Things, whole home/building control is becoming standard expectation. If you are unable to provide your clients the amount of control they've come to expect, someone else will.

Users are demanding a simple but integrated experience that is available from anywhere—driven by the rising significance of mobile device control. Convenience is at the forefront of consumer requirement, and mobile access to automation control is that convenience.

Automation control today is more accessible and more inclusive than ever before. Some of the features users of automation systems have come to expect are:

- *Smartphone accessibility*
- *Tablet accessibility*
- *Audio/Video control*
- *Energy efficiency settings*
- *An adaptable system that “learns”*

With these higher expectations, many are turning to upgrading existing automation systems to meet their standards. Upgrades are more cost effective than many other options but require an advanced and specified knowledge—many do not possess this level of training and are unable to provide this service to their clients.

Purchasing programming services provided by a System Design service representative can help save you time when performing a system upgrade. Doing this will yield higher customer satisfaction and will allocate higher profit for you. When performing system upgrades, this service should be used by those wishing to save time and money.

Vantage is offering this programming service exclusively to its valued customers. With this service, you will receive:

- *Programming to upgrade clients' QLink systems to the new InFusion system*
- *Access to master controller loaner program for systems that are down*
